

Specification Amendments:

Paragraph bridging pages 4 and 5:

It is generally understood by those of skill in the art that a pathologist must relay and preserve information regarding the position and orientation of the histological findings. This position and orientation information is typically communicated to the surgeon, particularly in cases where a cancerous tumor cancer has not been completely excised (e.g., where there are "close" or "dirty margins"). Such information is useful to the surgeon so that she may re-visit the surgical ~~cite~~ site in order to totally excise any remaining cancerous tissue.
